KLAUSUR STRÖMUNGSLEHRE

Fragenteil

Bitte direkt auf die Angabe schreiben, Blatt wenden!

- 1) Wie ist die Prandtl-Zahl definiert und wie kann man sie interpretieren? (2P)

- 2) Welchen Wert nimmt die Reynoldszahl für kriechende und für reibungsfreie Strömungen an? (2P)

- 3) Skizzieren Sie eine Prandtl-Sonde und geben Sie die zu messenden Größen an. Wie kann daraus die Strömungsgeschwindigkeit in inkompressibler Strömung bestimmt werden? (5P)

- 4) Wie lautet der Prandtl'sche Mischungswegansatz? (1P)

- 5) Ein geschlossener Körper wird inkompressibel, reibungsfrei und eben umströmt.
 - a) Welche Richtung hat die auf den Körper wirkende Kraft? (1P)

 - b) Hat der Körper einen Widerstand? (1P)

 - c) Was besagt der Satz von Kutta-Jukowski? (1P)

6) Von zwei quadratischen Platten wird die eine senkrecht, die andere parallel angeströmt. Die Abbildung zeigt den Widerstandsbeiwert über der Reynoldszahl gebildet mit der jeweiligen Plattenlänge und der Anströmgeschwindigkeit.

$$u_{\infty} = 5 \text{ m/s} \quad L_1 = 1 \text{ m} \quad \rho = 1,25 \text{ kg/m}^3$$

$$\nu = 15 \cdot 10^{-6} \text{ m}^2/\text{s}$$

- a) Erläutern Sie den Unterschied zwischen Reibungs- und Druckwiderstand? (2P)
 - b) Wie groß muss L_2 sein, damit die Widerstände gleich groß sind (Ann. $Re_2 > 1000$) (5P)?
 - c) Wie skaliert (näherungsweise) der Widerstand mit der Anströmgeschwindigkeit (2P)?
- 3) Nachdenkfrage: Die kritische Machzahl Ma_c in der Umströmung eines Körpers ist definiert als diejenige Machzahl, bei der erstmals eine supersonische Strömung an einem Punkt an der Körperkontur erreicht wird (wir nehmen Reibungsfreiheit an). Was denken Sie, hat ein unendlich ausgedehnter Zylinder oder eine Kugel (angeströmt in radialer Richtung) eine höhere Ma_c ? Kurze Begründung. (3P)

KLAUSUR STRÖMUNGSLEHRE

Achtung: nicht alle Angaben sind zur Bearbeitung der Teilaufgaben notwendig!

- 1) Gegeben ist der folgende, abgebildete Rasensprenger. Er operiert bei einem Einlass-Überdruck von 140kPa und der gesamte Volumenstrom ist 4.0L/min. Jeder Freistrahл aus den Enden besitzt eine Anfangsgeschwindigkeit von 17m/s (relativ zum Sprinklerarm) in eine Richtung, die gegenüber der horizontalen um 30 Grad nach oben geneigt ist. Er rotiert um eine vertikale Achse und die Reibung erzeugt ein Drehmoment von 0.18Nm *entgegen* der Drehrichtung.

Annahme: stationär, uniforme Strömung, laminar

- Geben Sie zuerst die Geschwindigkeitskomponenten am Rohraustritt in und senkrecht zur Rotationsebene, sowie den Massenfluss durch ein Rohrende an.
- Wie groß ist die stationäre Rotationsgeschwindigkeit ω ?
- Wie groß ist das Moment, sollte der Sprinkler festgehalten werden?
- Wie groß ist die von dem Wasserspray benetzte Fläche für Aufgabe b)?

- 2) In einem senkrecht stehenden Rohr (Radius R_2), gefüllt mit einem homogenen Fluid (Dichte $\rho_F = \text{const.}$, Viskosität $\mu = \text{const.}$) bewegt sich ein zylindrischer Stift (Radius R_1 , Länge L , Dichte $\rho_k = \text{const.}$) mit konstanter Geschwindigkeit U_0 . Für eine näherungsweise Berechnung sollen folgende Annahmen gemacht werden:

- Im Ringspalt liegt eine über die gesamte Stiftlänge L **laminare, inkompressible** und **stationäre** Strömung vor
- Der Druckgradient $\partial p / \partial x_i$ ist **nur** von der Vertikalkomponente z abhängig und kann aus der *hydrostatischen* Grundgleichung berechnet werden. Er ist konstant.
- Für das Gewicht des Stiftes ist L die relevante Abmessung
- Sämtliche Strömungsgrößen ausser dem Druck sind eine Funktion von r allein (**voll entwickelt**)
- Gegeben: R_2 , L , $x = R_1/R_2$, U_0 , ρ_k , ρ_F , g , μ

a) Wie lautet die Beziehung für den Druckgradienten im vorliegenden Fall?

b) Welche Randbedingung erfüllen die Geschwindigkeiten? Zeigen Sie anhand der Konti-Gleichung, dass $u_r = 0$ ist: $\frac{\partial u_z}{\partial z} + \frac{1}{r} \frac{\partial r u_r}{\partial r} + \frac{1}{r} \frac{\partial u_\varphi}{\partial \varphi} = 0$. (Tipp: Nutzen Sie die Randbedingung)

c) Gegeben ist die NS-Gleichung in z -Richtung

$$\frac{\partial \rho u_z}{\partial t} = - \frac{\partial \rho u_z u_z}{\partial z} - \frac{1}{r} \frac{\partial \rho u_z u_\varphi}{\partial \varphi} - \frac{1}{r} \frac{\partial r \rho u_z u_r}{\partial r} - \frac{\partial p}{\partial z} + V_z$$

mit

$$V_z = \frac{\partial \tau_{zz}}{\partial z} + \frac{1}{r} \frac{\partial \tau_{z\varphi}}{\partial \varphi} + \frac{1}{r} \frac{\partial r \tau_{zr}}{\partial r} - \rho_F \cdot g \quad \text{und} \quad \tau_{zr} = \mu \frac{\partial u_z}{\partial r}$$

Vereinfachen Sie die Gleichung so weit wie möglich, unter Verwendung der oben genannten Annahmen, sowie a) und b), so dass sie eine gewöhnliche Differentialgleichung für $\tau_{zr}(r)$ erhalten.

d) Ermitteln Sie die Schubspannung $\tau_{zr}(r)$ sowie die Geschwindigkeit $u_z(r)$ durch Integration unter Verwendung der Randbedingungen.

e) Für welches Radienverhältnis gibt es an der Stiftwand die geringste Wandschubspannung?

(Rechnen Sie mit $\tau_{zr} = \text{const} \cdot \frac{U_0}{r \ln(R_1/R_2)}$ falls Sie d) nicht lösen konnten)

f) Skizzieren Sie Geschwindigkeit und Schubspannung für $U_0 > 0$ und $U_0 < 0$ (Hinweis: sollten Sie Teilaufgabe d) nicht gelöst haben nutzen Sie auch hier die Angabe in e))

- 3) Der Einlass des Strahltriebwerks eines Überschallflugzeugs hat die Aufgabe, mit einer Kombination schräger und ebener Verdichtungsstöße die angesaugte Luft zu komprimieren, um der nachfolgenden Brennkammer eine subsonische Strömung bereitzustellen. Ein maßstäbliches Modell eines solchen Triebwerkeinlasses soll in einem Überschallwindkanal untersucht werden. Die Überschallströmung in der Messstrecke wird durch eine Laval-Düse erzeugt, die an einem sehr großen Kessel angeschlossen ist. Der Druck und die Temperatur der Überschallströmung in der Messstrecke sollen den realen Umgebungsbedingungen einer Flughöhe von $H = 12\text{ km}$ entsprechen. Im Triebwerkeinlass bilden sich ein schräger und ein ebener Verdichtungsstoß. Die Luft strömt nach dem zweiten Stoß subsonisch weiter. Der Massenstrom der in das Triebwerk angesaugten Luft ist $\dot{m}$.

Gegeben sind: $Ma_1 = 3$; $p_1 = 0,2\text{ bar}$; $T_1 = 217\text{ K}$; $\gamma = 1,4$; $R = 287\text{ J/(K kg)}$; $A_1/A^* = 4,23$; $b = 0,1\text{ m}$; $\dot{m} = 6\text{ kg/s}$; $\theta = 25^\circ$; $H = 12\text{ km}$

- Wie hoch muss der Druck p_0 im Kessel sein, damit für Ma_1 der Druck p_1 erreicht wird?
- Auf welche Temperatur T_0 muss die Luft im Kessel vorgewärmt werden, damit T_1 erreicht wird?
- Berechnen Sie die Luftdichte ρ_0 im Kessel und ρ_1 in der Messstrecke.
- Das Modell des Triebwerkeinlasses habe die Tiefe b zur Zeichenebene. Wie groß muss die Höhe h_1 des Einlasses sein, damit der erforderliche Massenstrom $\dot{m}$ angesaugt werden kann?
- Die Position der unteren Einlasslippe kann verstellt werden, um den Triebwerkeinlass auf verschiedene Anströmmachzahlen einzustellen. Wie groß muss der horizontale Abstand L_1 bei dem gegebenen Ablenkwinkel θ und der Einlasshöhe h_1 gewählt werden, damit der erste Stoß genau an den beiden Einlasslippen anliegt (Hinweis: Wenn Sie d) nicht lösen konnten, rechnen Sie mit $h_1 = 0,03\text{ m}$ weiter)?
- Wie groß sind die Mach-Zahl Ma_3 und der Druck p_3 hinter dem zweiten Stoß?
- Bestimmen Sie den Totaldruckverlust im Triebwerkeinlass.
